Projects

Fake Account Detection From Social Media

Online social networks such as Facebook or Twitter contains user's details, and some malicious users will hack social network database to steal or breach users information. Therefore to protect the users data, this project uses artificial neural networks (ANNs) to identify whether given social network account details are from genuine or fake users. ANN algorithm will be trained with all previous users fake and genuine account dataset and then whenever we gave new test data then ANN pretrained model will be applied on new test data to identify whether the given new account details are from genuine or fake users.

IDENTIFYING OF FAKE PROFILES ACROSS ONLINE SOCIAL NETWORKS USING NEURAL NETWORK

Developed a project using Artificial Neural Networks (ANNs) to identify fake accounts on social networks such as Facebook and Twitter. Addressed issues of user data breaches by analyzing features like the number of posts, friends, and account age. Trained the ANN with datasets of known fake and genuine

accounts to create a model capable of distinguishing new accounts as genuine or fake, enhancing user data protection.
